...Discovering value in natural resource stocks

Marifil Mines (MFM-TSXV)

The following editorial is extracted from the February 2008-2 Issue

Marifil Mines reported 35 holes drilled by its joint venture partner Castillian Resources (CT-TSXV) at the Las Aquilas West deposit, located 40 kilometers west of San Luis, Argentina. The deposit was explored previously for its nickel content. The recent drilling confirms the presence of significant platinum and palladium values, with 15 holes returning better than a gram of platinum. The combination of nickel, copper, cobalt, platinum and palladium in the drill results look very encouraging. Geophysics suggests that the mineralization could extend 300 meters south and 150 meters north of the presently outlined zone, providing scope for a substantial deposit.

Drilling will soon resume in a program designed to outline a resource over the coming months. Marifil is carried to production by its partner.

At the San Roque project in the Rio Negro province in Argentina, results from two holes cut long intervals of base metals with gold. All 51 holes drilled on the property to date have intersected mineralization. Marifil is

analyzing the new information along with geophysical results and is planning a 10,000 meter drill program to further explore the property.

Marifil has 34 exploration properties in Argentina encompassing gold, silver and base metals. Joint venture partners are contributing to funding on some of the projects. Positive results from any of the properties could move the share price significantly.

Price February 28, 2008: C\$0.65

Shares Outstanding: 25 million

Shares Fully Diluted: 32 million

Market Cap: C\$16 million
